

# Cross-talk with test pulses (again)

Cross-talk appears for a charge above 18ke<sup>-</sup>

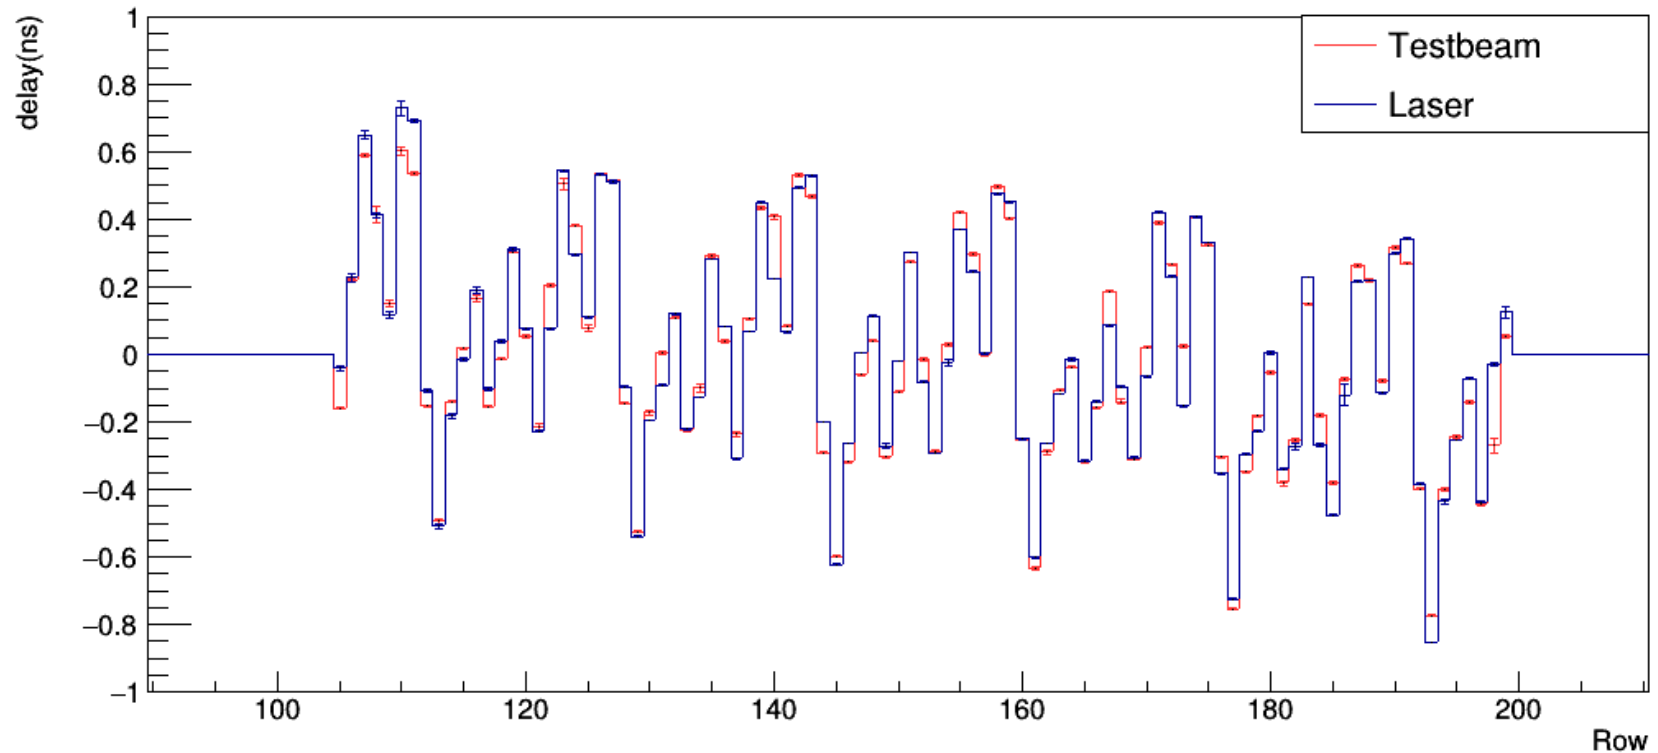

Max. injected charge is below 18ke<sup>-</sup> for most pixels...

The delay of the pixels that show cross-talk does not depend on the injected charge

# Testbeam vs laser setup

Now with error bars!

The difference per row is in the order of 10/100 ps. Could this be due to temperature/humidity etc?
