

# Building a sample chamber for measuring the reflectivity and transparency of detector materials at VUV wavelengths.

Casimir van der Post

# NIKHHEF

## Contents

- Background
- Project goals
- Research questions
- What has been done
- What is planned

# Background

- Standard Model of particle physics
- Dark matter
- Galaxies
  - Mass from rotational velocities
  - Mass from luminosity
  - Mass from gravitational lensing
- Methods
- Interactions

# Goals

- Optical behaviour
- PTFE (polytetrafluoroethylene)
- Visible light
- Below 250 nm
- VUV region 175-178 nm
- Different treatments
- Reflectance and Absorbion

(Kadkhoda et al, SPIE, 3578, 544)

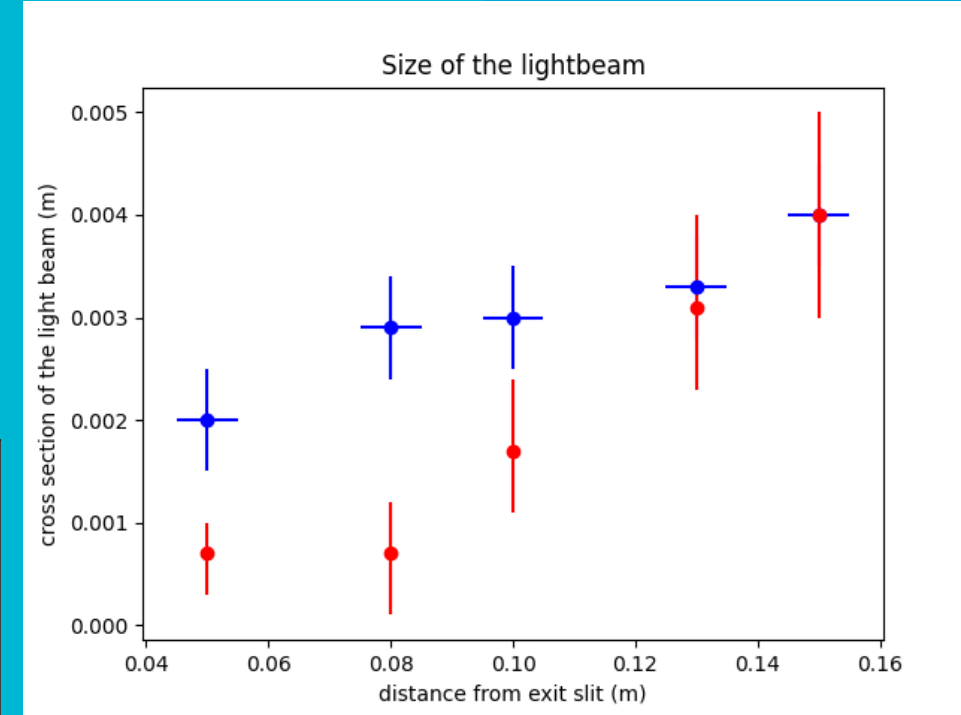

# Research questions

- Are the specifications to which this experiment is designed correct?
  - Will the experiment give the same results as previously done experiments?
  - What is changed as per previous experiments that changes the outcomes of the current experiment?
- Using the standard prefabricated vacuum components, what configuration of the vacuum chamber can fulfil the specifications?
  - Do we need custom-made components?
  - If so, what must they look like?
- What is the best way to record data from temperature and photon sensors located inside the vacuum chamber?
  - What kind of data acquisition system is suitable?
- How will PTFE that is cleaned with different methods reflect or absorb VUV?
  - *Optional:*
- How will coated samples reflect or absorb VUV? (Extra? I think the focus starts with the PTFE samples)

# What has been done

```
1 """
2 Created on 22-7-2021

5 """
6 from mpl_toolkits import mplot3d
7 import matplotlib.pyplot as plt
8 from matplotlib.ticker import MaxNLocator
9 import numpy as np
10 import math
11 import random
12
13 x = np.around(np.arange(-0.01,0.4,0.00001),5) # Global value for x rounded to 5 decimals
14 dSlit1 = 0.15 # distance from L to S1 in meters
15 wSlit1 = 0.003 # width of S1
16 dSlit2 = 0.15 # distance from G to S2
17 wSlit2 = 0.003 # width of S2
18 dGrat = 0.195 # distance from S1 to G in meters
19 gratAngle = math.radians(32) # angle of the normal of the grating to the entrance axis in radians
20 gratSize = 0.04 # size of the grating in meters
21 wLight = 0.004 # size of the light source
22 lightSource = [[-(wLight/2),(wLight/2)],[0,0]] # coordinates of the light source
23 Slit1 = [[(-wSlit1/2),(wSlit1/2)],[dSlit1,dSlit1]] # coordinates of S1
24
25 def grat_x(angle):
26     return np.round((gratSize/2)*math.cos(angle),5)
27
28 def grat_y(angle):
29     return np.round((gratSize/2)*math.sin(angle),5)
30
31 grating = [[-grat_x(gratAngle),grat_x(gratAngle)],[(dSlit1+dGrat-grat_y(gratAngle)),(dSlit1+dGrat+grat_y(gratAngle))]] # distances in x and y
32
33 """
34 We will now calculate the slopes of the two crossing beams because they create the most area inside the monochromator
35 the slope will be calculated according to a = (y1-y2)/(x1-x2)
36 Beam1 will be the light ray from the left side of the lamp
```

# What needs to be done

## July:

- Learn how the vacuum chamber is designed and why, what are the requirements.
- Finalize design sample holder
- Understand the monochromator (Understand the path the light will take)
- Plan monochromator motor control, make a parts list for motor control

## August: (Joined by a PhD)

- Assemble and test motor control
- Send CAD drawings of the sample holder to workshop, prototype
- Setup the procurement of the samples
  - What's on the shelf
  - Contact other institutions
  - Design the table for the equipment

## October:

- Building
- Start commissioning

## November:

- Calibration

## December:

- Measuring samples
- Process results

Thank you for your attention
